

**Application Memo****Determination of Sulfamine for Industrial Use**

Industry	Organic chemical industry
Instrument	Automatic potentiometric titrator
Measurement method	Redox titration
Standards	JIS K 9066

**1. Overview**

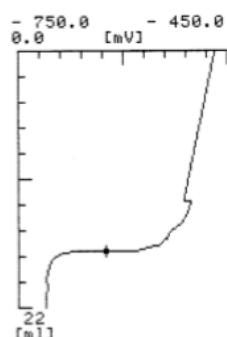

Quantitative determination of Sulfamine is according to JIS K 9066-2019 Sulfanilamide (Regent). The test sample after hydrochloric acidified is dissolved with potassium bromide and titrated with the 0.1mol/L sodium nitrite solution up to the maximum inflection point on the titration curve while maintaining temperature between 10 and 15°C. Sulfamine concentration is calculated from the titration volume of the 0.1mol/L sodium nitrite solution.

**2. Apparatus**

Main unit	Automatic potentiometric titrator (preamplifier STD)
Electrode	Combined platinum electrode Temperature compensation electrode

**3. Reagents**

Titrant	0.1mol/L sodium nitrite
Solvent	Pure water
Reagent	Hydrochloric acid, Potassium bromide

**4. Example**

—Measurement results—			
	Sample (g)	Titer (mL)	Concentration (%)
1	0.3087	17.2313	96.13
2	0.3117	17.3658	95.94
3	0.3052	17.0013	95.93
Average			96.00
SD			0.11
RSD(%)			0.11

—Titration curve—
